What do we need??

easy to use service to query, understand and analyse data

Business intelligence (BI) web platform

BI application allowed business people to acquire useful knowledge from data

SpagoBI is a complete suite for development of Business Intelligence project in an Open Source integrated environment, developed and distributed by an Italian company, the Italian Engineering Informatica SPA

# Global Geothermal Energy Database - IGA

Database content:

- ✓ IGA periodically collect geothermal data
- ✓ Every 5 years for World Geothermal Congress countries provide an update on national geothermal use (power and direct use)

The GGED was developed by the IGA in cooperation with the Institute of Geoscience and Earth Resources (CNR), Italy.

Updates are conducted by the CNR following the regular content update of IGA.

# Global Geothermal Energy Database - IGA

## Database contents:

- ❑ Geothermal fields (location – field owner – geothermal plants)
- ❑ Geothermal plants (typology – plant owner - turbine)
- ❑ Turbine (installed and running capacity [MWe] – produced energy [GWh] – status - COD)
- ❑ Direct use of the heat (type of use – installed capacity [MWth] – annual production [TJ]/year))

### Typology of plants

- Binary
- Single flash
- Double flash
- Back pressure
- Dry steam
- Hybrid

### Category of uses

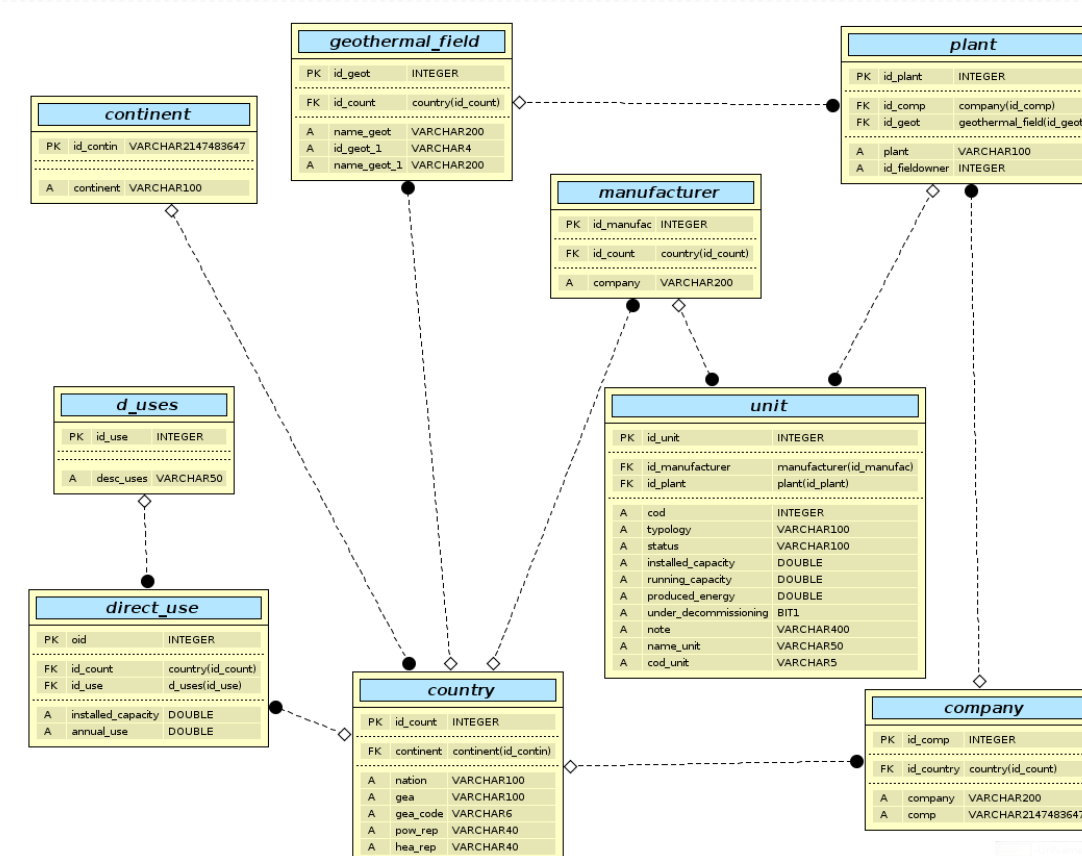

- Individual space heating
- District heating
- Air conditioning (cooling)
- Greenhouse
- Fish farming
- Animal farming
- Agricultural drying
- Industrial process heat
- Snow melting
- Bathing and Swimming
- Geothermal heat pumps
- Other uses

# Global Geothermal Energy Database - IGA

## Database Remarks:

- The IGA database consists of 9 tables in total
- Two of them are simple vocabulary tables (continent and d\_use)
- Geothermal field has spatial characteristics
- The tables contain a range of rows varying from the 25 of the 'Manufacturer' table to the 916 of the 'Unit' table
- Total rows are about 2100 rows
- The table 'Unit' is the most rich in information with its 13 descriptive fields
- The whole database is about 45 Mbytes exported in a textual intelligible format, the dump file

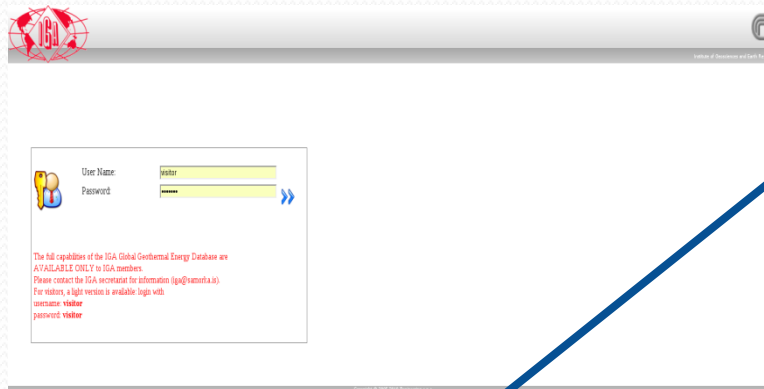

# Global Geothermal Energy Database - IGA

The web application allows the login for two kinds of user:

- ✓ i) igamember
- ✓ ii) visitor

The screenshot displays the IGA (Institute of Geosciences and Earth Resources) Geothermal Energy Database interface. The interface includes a Control Panel with layers (Background layers, Overlays), Measurement, Analysis, and Legend sections. The Analysis section shows the 'Installed Capacity' indicator with a range of 2 to 20. The Legend section shows a color-coded scale for installed capacity in MW, ranging from 0 to 3129.1.

The main window displays a map titled 'Power Plant Country' with a 'Plant List by Country Geo' table. The table lists geothermal plants by country, field, plant name, unit, COD, typology, status, field owner, manufacturer, plant owner, installed capacity, running capacity, and produced energy.

**Keywords:** The Geysers, electric power, direct-use, ground-source heat pumps, energy savings, well drilled manpower, investments

### ABSTRACT

Geothermal energy is used for electric power generation and direct utilization in the United States. The present installed capacity (gross) for electric power generation is 3,048 MWe<sup>1</sup> (installed) with 2,024 MWe net (running) delivering power to the grid producing approximately 16,603 GWh per year for a 0.62 gross capacity factor and a 0.94 net capacity factor. Geothermal electric power plants are located in California, Nevada, Utah and Hawaii with recent installation in Alaska, Idaho, New Mexico, Oregon, and Wyoming, with 514 MWe being added the last five years. The two largest concentrations of plants are at the Geysers in northern California and the Imperial Valley in southern California. The Geysers continues to receive waste water from Clear Lake and Santa Rosa, California that is injected into the field and has resulted in the recovery of approximately 200 MWe of power generation. The lowest temperature installed plant is at Chena Hot Springs in Alaska, where binary cycle plants uses 74°C geothermal fluids to run three units for a total of 730 kW (gross). With the recent passing of the production tax credit by the federal government (2.0 cents/kWh) and renewable portfolio standards requiring investments in renewable energy, the annual growth rate for electric power generation over the past five years is 3.7 percent. The direct utilization of geothermal energy includes the heating of pools and spas, greenhouses and aquaculture facilities, space heating and district heating, snow melting, agricultural drying, industrial applications and ground-source heat pumps. The installed capacity is 12,611 MW and the annual energy use

### 1. INTRODUCTION

Geothermal resources capable of supporting electrical generation and/or direct use projects are found primarily in the Western United States, where most of the recent volcanic and mountain building activity have occurred (Figure 1). The San Andreas fault, running through California from the Imperial Valley to the San Francisco area, and the subduction zone off coast of northern California, Oregon and Washington and Cascade volcanism are the source of much of the geothermal activity in the United States. However, geothermal (ground-source) heat pumps extend the utilization to all 50 states. The total identified potential for electrical production is estimated at 21,000 MWe (above 150°C) and 42 EJ (between 90° and 150°C) of beneficial heat (Muffler, 1979), and a recent estimate by the U.S. Geological Survey estimates a mean probability of electrical power generation from identified geothermal resources in 12 western states during the next 30 years of 8,866 MWe (USGS, 2008), which would nearly triple the existing electrical capacity.
